

Hanno®-Injection Block

PU Injection Resin

Properties

- Quick and easy injection directly into multi-functional tapes
- Creates pressure-resistant areas for absorbing weight loads and additional loads
- Easy to handle thanks to delayed curing process
- Once installed, the injection blocks can be positioned flexibly – without having to determine their position in advance

To create pressure-resistant areas in multi-functional tapes

Hanno®-Injection Block is a PU injection resin injected at specific points in multi-functional tapes. After curing, the resin is pressure-resistant and absorbs the weight loads and additional loads, which occur for windows and doors – such as backfilling of fittings to achieve burglary protection requirements (tested up to resistance class RC3).

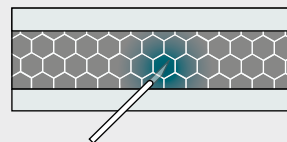

The resin is injected directly into the installed multi-functional tape, and the tape does not need to be notched before installation.

Suitable for pre-compressed multi-functional sealing tapes made from polyurethane soft foam with acrylate dispersion impregnation.

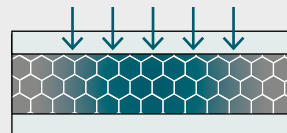

Delivery in common construction cartridges for handling with standard cartridge guns.

Cleaning of equipment only in non-cured state with common PU gun foam cleaner.

Application

Precise injection into the installed multifunctional tape

After curing, the resin is pressure-resistant and durable
